Visionary Africa

Project handover and full plan · written 20 October 2026

> **How to use this document.** Give it to a fresh Claude session (for example Claude Remote Control on your PC) together with the repository link. Tell it: *"Read this handover and HANDOVER.md in the repo, then continue from section 8."* A new session remembers nothing from earlier chats, so this document is its memory.

1. The project in one paragraph

Visionary Africa is a WordPress news and blog site about entrepreneurs and innovators across Africa. The owner wants new, original, well-researched stories published on a steady schedule, with AI doing the research and first drafts and a human approving every story before it goes live. The site is hosted on Hostinger. The goal is control of a new site, not income.

2. Where everything is

Item	Detail
Live site	https://olivedrab-donkey-447597.hostingersite.com/ (WordPress installed, PHP 8.3, LiteSpeed cache, Hostinger hPanel)
GitHub repo	SAITAMARSA/Holdings (currently **public**)
Working branch	`claude/viraly-wordpress`
Theme	`viraly/`, shown in WordPress as "Visionary Africa"
Plugin	`visionary-africa-sources/`
Handover in repo	`HANDOVER.md` (short version of this document)
Unrelated files	`index.html`, `arcade.html`, `games.html`, `assets/` belong to an old gaming-site project on another branch. Ignore them.

3. Editorial rules (agreed with the owner)

- **No scraping and republishing.** Other sites are used only as **topic inspiration**, for example spotting a story about a new startup.
- For each lead, AI researches across the web (the company's own site, its history, other coverage) and writes an **original** story from the collected facts. It must not copy, or closely paraphrase, any single article.
- Every article shows an **AI-assisted disclosure** and a linked **Sources** list.

- Bylines are real people or a clearly labelled "Visionary Africa Staff". **No invented author personas.**
- **Cadence:** once a day, about 4 stories. Quality over quantity.
- Output is saved as **WordPress drafts**. Nothing publishes without the owner's approval.
- Stories about real people and companies must be fact-checked. AI can get names, amounts and dates wrong, and a published error about a named founder is a real risk.

4. What has been built

4.1 Theme: Visionary Africa (`viraly/`)

- Mobile-first blog and news layout: lead story, latest grid, category sections, article page, pages, archives, search, 404, comments, dark mode.
- Menus: "Primary" and "Footer" locations. With no menu set, the header lists the top categories.
- Brand colour is the `--accent` variable at the top of `style.css` (currently green).
- All PHP files pass a syntax check. **Not yet tested inside a real WordPress install**, so expect small visual fixes once it is activated.

4.2 Plugin: Visionary Africa Sources (`visionary-africa-sources/`)

- Adds a "Sources and disclosure" box to the post editor. One source per line as `Title | https://link`.
- An "AI-assisted" checkbox, on by default. When on, the end of the article shows: "Researched with AI assistance and edited by Visionary Africa."
- Prints a linked Sources list at the end of each article.
- Passes a PHP syntax check; not yet run inside WordPress.

5. What is not built yet

5.1 Daily research and drafting pipeline

1. Read 3 to 5 topic-source sites or feeds (the owner still has to choose them).
2. Pick the best ~4 leads of the day (new startup, funding round, launch, founder profile). Skip anything already covered.
3. For each lead, research: the company's own site, history, founders, funding, other coverage. Save every fact with its source link.
4. Write an original 500 to 800 word story in the Visionary Africa tone, using only the saved facts.
5. Create a WordPress **draft** through the REST API with category, sources and the AI-assisted flag set.
6. Trigger the approval email (5.2).

AI choice: Gemini. It has built-in Google Search with citations, which suits the research step. DeepSeek is cheaper per token but has no built-in web search, so it would need a separate search API. At 4 stories a day the cost difference is small. The writing step could later switch to DeepSeek if cost matters.

5.2 Email approval

- Each morning WordPress emails the owner a digest: headline, short summary and sources for each draft, with **Preview**, **Approve & publish** and **Reject** links.
- Links carry a signed, single-use token that expires in 1 to 2 days.
- Approve opens a **confirmation page with a button**, not an instant publish, because mail apps and security scanners can open links automatically.
- Send with `wp_mail` through a Hostinger mailbox over SMTP.
- Approval by replying to the email was rejected: it needs mailbox parsing and could be forged.

5.3 Site structure

- Categories: Entrepreneurs, Innovators, Funding, and by country or region.
- Pages: About (with the AI-assisted editorial policy), Contact, Privacy, Corrections.
- Menus: assign Primary and Footer in Appearance → Menus.
- Settings: site title "Visionary Africa", permalink "Post name", a tagline.
- Roles: separate Author accounts for real writers, an Editor account for the owner.

5.4 Deployment to Hostinger

Option	How	Notes
Zip upload	wp-admin → Appearance → Themes → Add New → Upload (zip the `viraly` folder); same for the plugin under Plugins	Easiest, works from a phone.
SSH (best from the PC)	Run Claude Remote Control on the PC and upload with `rsync` to `wp-content/themes/` and `wp-content/plugins/`	The cloud session could not reach the server: its network blocks the SSH port, there was no private key, and no SSH client was installed.
Hostinger Git	hPanel → Advanced → Git	Copies the whole repo into the install path, so the theme should live in its own repo or branch with the files at the root.

6. Decisions made

Topic	Decision	Why
Platform	WordPress (not Laravel)	Best fit for a blog: mobile admin, multi-author, themes, SEO.

Where to work	Build in the cloud, then continue on the PC with Claude Remote Control	The PC can reach the server over SSH with its own keys.
Git account	Same account (SAITAMARSA)	Simplest.
Content approach	Topic inspiration + original researched stories	Avoids plagiarism and copyright problems and spam-policy penalties.
Cadence	Once a day, ~4 stories	Quality over quantity.
AI model	Gemini	Built-in search with citations.
Approval	Emailed signed links with a confirm page	Safer than reply-to-approve.

7. Things to be careful about

> **Public repo.** The GitHub repo is public. Never commit keys, passwords, tokens, the SSH private key, the Gemini key or WordPress passwords. Keep them in environment variables or an untracked `.env` file.

- **Accuracy:** every draft is human-reviewed before it goes live.
- **Fake personas:** the earlier idea of AI-generated author personas was dropped. Do not reintroduce it.
- **Live-site changes:** confirm with the owner before uploading anything to the live site.
- **Hostinger SSH details** (host, port, username, key) are held by the owner and are not stored in the repo. SSH users on Hostinger are usually per hosting account, so the same login likely works for this site; confirm in hPanel → Advanced → SSH Access.

8. Next steps, in order

1. **Owner:** pick 3 to 5 topic-source sites (African startup and business news).
2. **Owner:** give the email address for the daily drafts; create a Hostinger mailbox for sending (hPanel → Emails).
3. **Owner:** create a Gemini API key (Google AI Studio) and a WordPress Application Password (Users → Profile). Store them as environment variables on the PC, not in the repo.
4. **Claude:** install and activate the theme and plugin on the live site (zip upload or SSH); fix anything that looks wrong.
5. **Claude:** build the email-approval feature inside the Sources plugin.
6. **Claude:** build the daily pipeline script; run it once manually and review the drafts.
7. **Claude:** set categories, menus and core pages; write the editorial policy page.
8. **Claude:** schedule the pipeline once a day (a scheduled task or a cron job on Hostinger).
9. **Both:** run for a week, review draft quality, tune the prompts and tone.

9. How to start on the PC

```
git clone https://github.com/SAITAMARSA/Holdings.git visionary-africa
cd visionary-africa
git checkout claude/viraly-wordpress
claude remote-control
```

Then tell the session: *"Read VisionaryAfrica-Handover.pdf and HANDOVER.md. Continue from section 8. Confirm before anything touches the live site."*

10. Ideas for later

- A weekly newsletter of the best stories.
- Founder and startup directory pages built from researched facts.
- Country and sector landing pages.
- Social posts generated from each published story, posted only after approval.
- Corrections log and a visible "last updated" date on stories.
- Basic SEO: sitemap, article schema, Open Graph images.
